EULER DIGITAL BLOCKCHAIN

Core Blockchain Network Engineer

Full Time – Sweden, Remote

Job description:

Euler Digital is currently in the process of creating a sovereign/independent blockchain network, based on Polygon Edge. We need an engineer that will form the core of the development team, evolving the foundations of our blockchain network. You will join at a time where architecture, architectural guidelines and the first phases of network realization have already been done. We need a layer 1 blockchain engineer skilled in Golang and a firm grasp on the theoretical underpinnings and practical concepts on which blockchain network operates. The network has a Solidity/Ethereum compatible smart contract execution core. Understanding of the differences between Ethereum compatible networks and Bitcoin compatible networks is a plus.

We want to bring you on as part of the core team that will evolve the network in the years to follow.
